

### BASICS

#### 1 Create a separate project folder for AI sandbox

Keep all AI experiments and files in a dedicated folder to stay organized and isolated.

#### 2 Assign confidentiality settings and rules

Set clear confidentiality level, data handling rules and sharing restrictions.

#### 3 Always attempt to provide context

Provide sufficient background, goals, constraints and examples for better results.

#### 4 Use the chat ("Ask") for questions, agents for complex tasks and coding

Use "Ask" for quick answers; use agents/workflows for multi-step tasks and coding.

#### 5 Be wary of spending a lot of tokens on simple tasks

Keep prompts concise for simple tasks to save time and cost.

#### 6 Keep a single chat for a coherent thread

Start a new chat when context limit is approached or the topic changes significantly.

### </>

### CODING

#### 7 Create data structures, empty files or templates in advance

Prepare the structure and scaffolding before asking AI to fill in the details.

#### 8 Use dummy objects to provide context while keeping it confidential

Use realistic dummy data/objects instead of sensitive information.

#### 9 Avoid large prompts with multi-tasking – take it step by step

Break complex tasks into smaller steps and iterate.

#### 10 Use complex models only for complex coding tasks

Use advanced models only when needed; otherwise use faster/cheaper options.

#### 11 Be wary of providing large context – it may consume a lot of tokens

Avoid dumping long files or text unless necessary.

#### 12 Active version control system and frequent commits

Commit early and often. Keep your work safe and reversible.

#### 13 Maintain changelogs for traceability, preferably automated where possible

Track what changed, why, when and by whom/what.
